APP Case to TRPG Migration Mapping

Overview

This folder contains field-level and process-level CSV mappings for migrating APP Case Record Types to their corresponding TRPG target objects as part of the org merger. The APP org's Case object (138 fields, 19 active Record Types, 13 record-triggered flows, 22 active validation rules, no Apex triggers) is being decomposed across multiple TRPG custom objects that better align with each workflow's domain.

Assumptions

- **Skience is being retired.** The Skience Financial Solutions managed package (`SkienceFinSln__*`) will not be carried forward. All Skience fields on Case (Engineering Req Number, Potential Liability, Product, SLA Violation) are flagged as orphaned/do not migrate. Any formulas or references that traverse Skience fields (e.g., `APP_Custodian__c` which reads `FinServ__FinancialAccount__r.SkienceFinSln__Product_Company__c`) will need to be repointed to the replacement account opening solution's equivalent fields once available.
- **Geopointe geocoding** (`geopointe__Geocode__c`) is also not in use on APP Cases and is excluded from migration.
- **No Apex triggers** exist on Case in the APP org. All automation is declarative (flows + validation rules).

Target Object Routing

APP Case Category	TRPG Target Object	Key Differentiator
Trade Requests	`New_Account_Setup__c`	Uses `Account_Setup_Type__c = Trade Request`

APP Case Category	TRPG Target Object	Key Differentiator
New Account Opening	`New_Account_Setup__c`	Uses `Account_Setup_Type__c = New`
Account Changes	`New_Account_Setup__c`	Uses `Account_Setup_Type__c = Change`
Cash Reserve Updates	`New_Account_Setup__c`	Uses `Account_Setup_Type__c = Reserve Change`
Transfers	`TRPG_Help_Desk__c`	Work Item RT
Account Maintenance	`TRPG_Help_Desk__c`	Work Item RT
Client Maintenance	`TRPG_Help_Desk__c`	Work Item RT
Asset Flow Exceptions	`TRPG_Help_Desk__c`	Work Item RT
RPS (13 Record Types)	`TRPG_Help_Desk__c`	Work Item RT
Firm Initiatives	`TRPG_Help_Desk__c`	Work Item RT
Raise Cash (Urgent)	`Raise_Cash_Request__c`	Dedicated object
Tax Return	`Case`	RT swap only — stays on Case

Files

`Case_to_HelpDesk_Field_Level_Mapping_v2.csv`

The primary deliverable. Contains ~175 rows mapping individual APP Case fields to their TRPG target fields across all scopes. Columns include:

Column	Purpose
Scope	Functional grouping (Standard, Trading, Transfers, RPS, Orphaned, etc.)
Category	Sub-classification within scope
APP Field Label / API Name / Type / Length	Source field metadata
TRPG Target Object	Which TRPG object receives this field
TRPG Field Label / API Name	Target field (or `NEW FIELD NEEDED` / `NEW FORMULA NEEDED`)

Column	Purpose
TRPG Field Exists	Whether the target field already exists on the TRPG object
Mapping Type	Direct / Transform / Constant / Not Mapped / etc.
Picklist Value Mapping	Value-to-value mapping where picklists differ
Action Required	What the migration team must do
APP Validation Rules	Which of the 22 active VRs reference this field
APP Flow Behavior	How the 13 Case flows use this field
TRPG Flow Behavior	Existing automation on the target object
Process Differences	Behavioral gaps between orgs
Notes	Additional context and confirmations

Orphaned fields (24 rows at the bottom) are APP Case fields with no references in any flow or validation rule. These are broken into:
- **3 custom fields** with no automation (`APP_Liquidate_Account__c`, `APP_Reason_for_Liquidation_Closing__c`, `APP_Verification_Needed__c`) — need APP team confirmation before discarding
- **1 display-only formula** (`APP_Household__c`) — derives from FA relationship, may not need migration
- **2 likely legacy fields** (`Check_Date__c`, `Check_Number__c`) — duplicated by APP-prefixed versions that ARE in automation
- **13 unused standard fields** — Web-to-Case fields, system fields, Contact-derived fields
- **5 managed package fields** — 4 Skience + 1 Geopointe (all excluded per Skience retirement)

`Case_to_HelpDesk_Process_Mapping_v2.csv`

Higher-level view mapping each of the 24 APP Case categories (18 Record Types + 4 screen-flow-created + Tax Return + Raise Cash) to TRPG target objects. Includes flow migration priority, field mapping complexity, related APP flows, validation rule counts, and detailed behavioral differences between orgs.

Key Architectural Differences

1. **Status-driven dates vs. date-driven status**: APP uses date fields to force status changes via validation rules (e.g., setting Completed Date forces Status = Completed). TRPG uses status changes to auto-set date fields via flows. Opposite patterns that must be reconciled.
2. **Chatter vs. Ticket Messages**: APP posts Chatter mentions for notifications. TRPG uses `Ticket_Message__c` child records + `Send_Message__c` boolean + `User_Ticket_Relationship__c` for structured messaging. Significant architectural difference.
3. **Case Team Members vs. User lookups**: APP creates up to 5 `CaseTeamMember` records per Case (RPS roles). TRPG has 2 inline User lookups (`Add_Member_1__c` / `Add_Member_2__c`) plus `User_Ticket_Relationship__c` child records.
4. **Custom metadata routing**: APP uses `APP_Case_Assignment_Config__mdt` to drive queue assignment for RPS cases. TRPG has no equivalent custom metadata routing pattern. This metadata must be migrated or replicated.
5. **Division vs. Department**: APP `Division__c` is a simple picklist (Avantax / APP / AWM). TRPG `Department__c` is a lookup to `trpg_Department__c` custom object.
6. **Contact on Help Desk**: TRPG `TRPG_Help_Desk__c` has no Contact lookup. APP Client Maintenance Cases require `ContactId`. A `Contact__c` lookup must be added to Help Desk.

Skience Retirement Impact

With Skience being retired, the following require attention beyond the orphaned managed package fields:

- **`APP_Custodian__c` formula** (on both Case and NAS): Currently reads `FinServ__FinancialAccount__r.SkienceFinSln__Product_Company__c`. This formula exists on the APP Case and is replicated as `Financial_Account_Custodian__c` on NAS. Both must be repointed to whatever field the replacement solution uses for custodian identification.
- **Any reports, dashboards, or list views** filtering on Skience fields should be audited during the migration.
- **NAS `Financial_Account_Custodian__c`** already exists as a formula on `New_Account_Setup__c` — confirm its source field still resolves after Skience

removal.

New Fields Required (Summary)

Across all scopes, the mapping identifies approximately:
- **~40 new fields** needed on `TRPG_Help_Desk__c` (RPS tracking dates, fee review fields, asset flow exception fields, maintenance dates, transfer tracking, etc.)
- **~20 new fields** needed on `New_Account_Setup__c` (trade-specific fields: Gross Amount, DCA, Hold in Cash/MM/IPS, Settlement Date, FSA fields, verification fields, etc.)
- **3 new formula fields** (FA Number derivation, Prior/Receiving Rep No derivation)
- **1 new lookup** (`Contact__c` on Help Desk)
- **Validation rules**: ~15 APP VRs must be replicated or adapted on target objects
- **Flows**: 3-5 new flows needed (auto-subject generation, status-date tracking, task creation, custom metadata routing, Chatter-to-Ticket-Message conversion)
